

2) Salary: 15,000, 20,000, 25,000, 22,000, 1,00,000

$$\text{Mean: } \frac{\sum x}{n} = \frac{15,000 + 20,000 + 25,000 + 22,000 + 1,00,000}{5}$$

$$= 36,400$$

* 2) Median: Formula: Odd = $\frac{n+1}{2}$ (arrange in asc)

even: $\frac{n_1 + n_2}{2}$

* 3) Mode: Most frequency in dataset.
(Count repeated number)

Assignment:

1. The marks of 8 students are:
45, 50, 55, 60, 65, 70, 75, 80

Find mean, median, mode.

1) mean:

$$m = \frac{\sum x}{n} = \frac{45 + 50 + 55 + 60 + 65 + 70 + 75 + 80}{8}$$

$$= \frac{500}{8}$$

$$= \underline{\underline{62.5}}$$

2) median:

Ascending Order: 45, 50, 55, 60, 65, 70, 75, 80

$$\text{median} = \frac{60 + 65}{2} = \frac{125}{2} = \underline{\underline{62.5}}$$

3) Mode: No value is repeated.

2) The daily sales (in units) of a shop for 10 days are:

120, 150, 130, 150, 160, 170, 150, 180, 140, 160

Calculate: Mean, median, mode.

→
1) mean:

$$m = \frac{\sum x}{n} = \frac{120 + 150 + 130 + 150 + 160 + 170 + 150 + 180 + 140 + 160}{10}$$

$$= \frac{1510}{10} = \underline{\underline{151}}$$

2) median:

Ascending Order: 120, 130, 140, 150, 150, 150, 160, 160, 170, 180

$$\text{median} = \frac{150 + 150}{2} = \frac{300}{2} = \underline{\underline{150}}$$

3) mode:

$$\text{mode} = \underline{\underline{150}}$$

3) The ages of 9 employees are:
22, 24, 25, 26, 26, 27, 28, 30, 32
Find: Mean, Median, Mode.

→

1) Mean:

$$m = \frac{\sum x}{n} = \frac{22 + 24 + 25 + 26 + 26 + 27 + 28 + 30 + 32}{9} = \frac{240}{9} = \underline{\underline{26.6}}$$

2) Median:

Ascending Order: 22, 24, 25, 26, 26, 27, 28, 30, 32

median: 26

3) Mode:

mode: 26
